1 Introduction

1.1 About Us:

Cloudshope Technologies is one of the leading Cloud telephony providers in India that offers cloud telephony for business. Our ready-to-use business software is designed considering every possible communication needs and can be customized as per business requirement. Our goal is to provide a simple yet powerful cloud based system that automates and streamline business communication processes to increase business efficiency and returns.

- 99.995% upline of our services
- Customizable pricing according to your requirements.
- Cost effective options achieve significant savings.
- 24x7 around the clock customer support.

Vision

The cloud communication solutions from Cloudshope ensure a stable and efficient communication between your customers and your business for higher ROI and Business Growth.

To provide the most comprehensive clouds based communication solution for a Business world with no boundaries.

Mission

To expand the Boundaries of Cloudshope from PAN India based services to all the places across the MAP.

Whether you're opening new offices, hiring remote workers, or expanding your in-house teams, cloud telephony will make the expansion effortless and cost-effective.

To lower your communication costs, enhance productivity, and increase your resilience. To eliminate the loopholes arising in your business and act as a single source of truth for business communication.

1.2 Our Server Infra:

All our servers are in highly secured environment in India tier 4 security data center CTRLS Noida with availability of 99.995%.

- Zero single points of failure.
- No more than 26.3 minutes of downtime per annum as a maximum figure.
- Tier IV providers have redundancies for every process and data protection stream. No single outage or error can shut down the system.
- Highly efficient technical architecture make sure that every cycle of CPU is used efficiently.

1.3 Security Compliance:

Security at CloudShope is integral part of our infrastructure. Starting from the Physical security to data protection everything is protected with multiple layers of security

- Gunmen at entrance and exit gates.
- Man-trap at the datacenter entrance.
- 24/7 security throughout the datacenter.
- Three levels of bio-metric access control for the server area.
- 24/7 CCTV monitoring.
- Restriction of access to visitors, if any.
- Identification check with proof of photo ID.
- Entry into data center only with escort.
- Retention of photos and video footage for 30 days.
- Multiple layers of Secure Database access
- Sufficient multi stage backup solution to restore data.
- Effective internal data security policies to secure customer data.

We also sign non-disclosure agreement with our customers if required by customers.

2 Services We Offer:

2.1 Bulk Voice Calls:

Our bulk voice call service allows one to send a pre-recorded message to a large group of people. With its simple process, one can create own voice message which can be sent across multiple customer databases and keep track records and earn profits. We assure you fastest and instant bulk voice call delivery to many people at large.

2.2 Bulk SMS:

Our SMS service is the most user-friendly and valuable product in the market. We have listed the important features

Features of Bulk SMS:

- 100% delivery
- Detailed report section
- Send on 1000's of the number at a time
- Date/Time scheduling available
- Send it with your own sender ID
- 1 Credit/SMS = 163 Characters in English and 70 Characters in Other language
- Send on both DND & NON-DND numbers (Transactional SMS) -Send on NON-DND numbers (Promotional SMS)

2.3 IVR Services:

Our IVR / Virtual Receptionist is the most user-friendly and valuable product in the market. We have listed the important features of IVR along with the Quotation. IVR Solution Generic Features:

- Email Reports: Custom email reports can be automatically generated daily through IVR for admin review purpose.
- Welcome Message: A welcome sound can be played when the customer's call-up on IVR number which creates professional touch.
- Programmable Extensions: IVR consists of extensions to route calls to the concerned department or person without any manual intervention.
- Call Logs: It consists of calls details such as the phone number of the caller, time, date, duration, status, etc. for creating a database, tracking & monitoring agents.
- Call Recordings: The IVR records conversation happened in each call between agent and customer for quality & training purposes.

- **Call Distribution:** All the calls get distributed smartly through IVR to the mapped agents ensuring smooth calls handling process.
- **Multi-Language:** IVR supports multi-language like English, Hindi or any regional language for good customer experience.
- **SMS Alert:** There are some situations to generate SMS such as thank you SMS to the customer after the finish of each call or the agent gets SMS if any call is missed out.
- **Multi-Level IVR:** Creating a multi-level IVR in order to help callers navigate to the correct person or greeting more easily, without having to hear too many options in one go.
- **Sticky Agent:** It lets you automatically connect callers to agents they have previously interacted with, so the agent can discuss further based on the previous interaction.
- **In-call Transfer:** The IVR system enables an agent to transfer the active or current call to some other telephone number or agent.
- **After Hours Support:** The IVR system redirects calls after office hours to the mapped phone number ensuring great customer experience.

2.4 Missed Call Service:

Our Missed Call/Toll-Free Missed call service is the most user-friendly and valuable product in the market. We have listed the important features of Missed call service along with the Quotation.

- **Caller Tune** - You can greet your callers with a customized corporate jingle or pre-recorded voice message of 10-15 seconds instead of that two rings that are normally played at the time of giving a missed call.
- **Second SMS** - If you are receiving the missed call from the registered number then you can send a differently customized SMS like "You are already registered with us".
- **Sticky Agent** - Will give you an option where you can set the number of missed calls that you want to receive from a particular number "in a day" or "in a lifetime". So that there will be no duplicate entries in your panel.
- **Channel Lines** - The number of parallel calls that you can receive at the same point of time.
- **Auto Reply SMS** - On every account of a missed call, a text message can be triggered with the sender Id related to your business name.
- **Auto Reply Voice Call** - On every account of a missed call, a call back to the user or predefined IVR message can be triggered.
- **Auto Reply what's App** - An image, text or video can be the trigger on every account of a missed call.

2.5 Click-To-Call

It is also known as click-for-talk or click-to-dial refers to a type of digital communication in which a person clicks a button in order to be connected with another individual in real-time, without either of them actually dialing the number. In simpler terms, it allows a customer to receive a call from any business by just dropping their number on the company website/app.

2.6 Auto-Dialer:

The App is used for automating business communications, be it inbound or outbound calls. It helps in effectively and efficiently managing manpower.

This app provides a way to track your lead end to end using a sophisticated web based automatic CRM panel for both inbound and outbound calls.

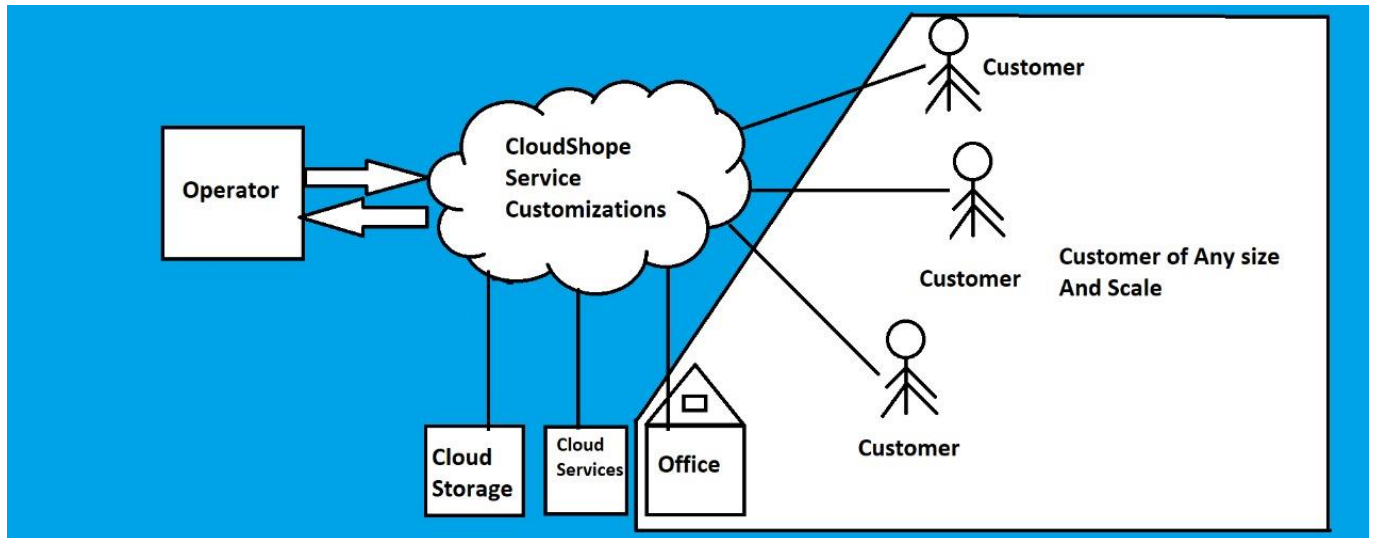

The app also bears the capability of communicating within your organization using VoIP (Voice over Internet Protocol) beta version.

2.7 Customized IVR Flow:

We designed customized flow which can be customized to any level of complexities. Can communicate with customer data over API on HTTP protocol or any voice protocol like SIP. We also provide integrations with cloud speech to text and text to speech providers with hybrid integrations with customer logic and data.

3 High Level Architecture:

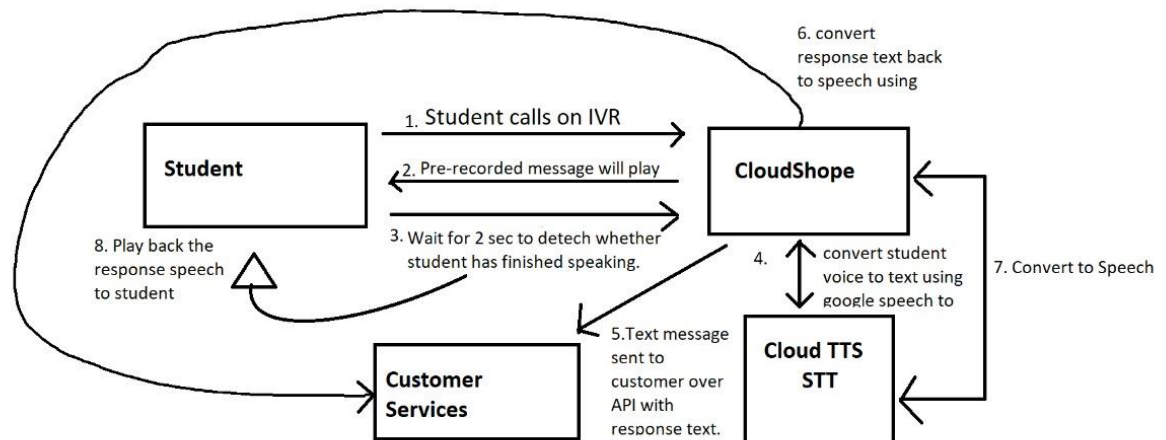

We are cloud telephony provider and provide telephony services over cloud.

4 Required Solution:

Customer requires an IVR with below functionality:

- Student will call IVR.
- We will play a pre-recorded message.
- We will wait for 2 second pause to detect that student has finished speaking.
- We will convert student voice to text using google speech to text.
- The text message will be sent to customer over API with response text.
- We will convert response text back to speech using google text to speech.
- Response speech will be played back to student.

5 Timeline

- Development and cloud integration time 3 weeks.
- Testing with customer system 1 week.
- Total timeline will be 4 weeks.
